LAB ACTIVITY 3

(Due October 7 @23:59)

Please submit the Jupiter notebook file or .py file with your answers. Please don't remove the error messages from the notebook.

1. *Use two variables named "minors" , "adults" and "seniors".* Write an if/ else statement that adds 1 to minors if age is less than 18, adds 1 to adults if age is 18 through 64 and adds 1 to seniors if age is 65 or older. Get the age from the user. (2 points)

2. *Use the variables k and total to write a while loop that computes the* ***sum*** *of the* ***squares*** *of the first 50 counting numbers, and associates that value with total. Thus your code should associate 1*1 + 2*2 + 3*3 +... + 49*49 + 50*50 with total. Use no variables other than k and total. (5 points)*

3. *Given that n refers to a positive int use a while loop to compute the* ***sum*** *of the* ***cubes*** *of the first n counting numbers, and associate this value with total. Use no variables other than n, k, and total. (5 points)*

4. *Write a program with for loop that prints all even numbers between two numbers entered by the user. (4 points).*
   Example: For input range 2 and 10, the output should be 2, 4, 6, 8, 10.

5. *Write a program that finds the sum of the digits of a number using a* `while` *loop. (3 points). Write another program that finds the sum of the digits of a number using a* `for` *loop. (3 points). Example: For input 1234, the output should be 1+2+3+4=10.*
